

# Lupo

Top quality product for the  
treatment of perennial weeds  
in established grassland

**Contains MCPA and 2,4-D two tried and tested actives which move throughout the plant attacking the root and shoots**

**Can treat a range of perennial weeds including Ragwort, Thistles, Docks and Nettles**

**Kind to grass**

### Key weeds and best timing

#### Ragwort

Apply at the rosette stage. Once erect growth takes place, treatment will not be effective. A second spray may be needed the following year as part of an eradication programme

#### Docks

Best controlled from seedling stage up to 15 cm (6 inches tall). Flowering Docks require cutting and re-growth treated when they reach about 15 cm

#### Common nettle

Apply when Nettles are 15 cm (6 inches tall)

#### Creeping thistle

Spray up to 25cm (10 inches high)

### Dose rate and water volume

Apply through tractor mounted sprayer at 4 litres/hectare in 200 litres/hectare of water. Only one application can be made per year.

### Knapsack application

Size of knapsack litres	Amount of LUPO ml	Volume litres
5	45	4.95
10	90	9.91
20	180	19.82

This method is recommended for spot treatment of weeds, e.g. clumps of Common nettle, Common ragwort, Docks or other weeds. Apply as a medium spray to just before run-off occurs.

*Treated Ragwort*

*Untreated Ragwort*

### Livestock withdrawal period

Remove livestock from field for at least two weeks. If poisonous weeds such as Ragwort are present, they must be fully decayed and unpalatable before livestock can return

### Best conditions to spray

Apply when weeds are actively growing in warm conditions. This is usually from April onwards. Do not apply if rain forecast within 12 hours of treatment. Do not spray in windy conditions when spray can drift onto neighbouring crops.

Follow all restrictions and precautions on the label
