

Nufarm further expands forestry portfolio

Nufarm is pleased to announce the registration of two new plant protection products with GRUNT® herbicide and Regent® 200 SC insecticide now added to its forestry portfolio.

According to Harry Pickering, Product Development Manager for Nufarm's Specialty Products, these new products demonstrate the company's commitment to the industry.

Offering effective pre- and post-planting weed control for *Pinus radiata* plantations, GRUNT herbicide is a high quality 750g/kg hexazinone formulation.

"Adding GRUNT to the mix extends our already diverse range of cost effective residual herbicides available to foresters," Harry said.

"It is effective on a range of annual and perennial weeds, along with some hard-to-kill woody weeds such as Bracken and Silver Wattle."

The registration of Regent 200 SC was approved by the Australian Pesticides and Veterinary Medicines Authority in March 2009 for the control of plague locusts and grasshoppers in forestry plantations.

"It is also pleasing to see the registration of Regent 200 SC for the forestry industry," Harry added.

"Using it for locust and grasshopper control is not new. However, in the past, application has been under various Emergency Use Permits.

"With the new label registration comes the guarantee that Regent 200 SC can be used when and where required. It gives plantation companies an effective option for their insect control strategies."
