

Nufarm introduces new Digger fungicide

The final component of Nufarm's Power Yield program is now in place with the release of new Digger fungicide.

Digger has been introduced to support the Power Yield program for control of early blight (target spot) in potato and tomato crops.

Containing 250g/L difenoconazole as the active constituent, this Group 3 DMI chemistry complements the other fungicide components that make up the Power Yield program – Filan, Polyram DF and Aero.

Available now in a 5L pack, Digger is an ideal fungicide for late season application in potatoes providing some curative effects and forward protection for the crop.

Technical and use information about Digger and the Power Yield program is available from the Nufarm sales and horticulture teams. Visit www.nufarm.com.au for details.
