

Weedmaster 360...the green glyphosate herbicide from Nufarm

Glyphosate herbicide has been used in Australia since the mid 1970's for the control of annual, perennial, brush and woody weeds in a wide range of situations.

In September 1995 the National Registration Authority (NRA) instigated a special review of glyphosate use in aquatic situations. This was due to studies that showed the surfactant used in glyphosate formulations, could under certain conditions, be harmful to aquatic fauna.

The NRA concluded that as from 30th June 1997 the only glyphosate products allowed for use in or near aquatic situations such as channels, drains and streams etc, would be those that complied with aquatic toxicity requirements.

We've blended a new environmentally safe surfactant with glyphosate to produce Weedmaster 360 Herbicide, a formulation which satisfies all NRA requirements for aquatic safety.

Weedmaster 360 Herbicide with built-in surfactant that's environmentally safe

Surfactants (or wetting agents) reduce the surface tension of spray droplets. They ensure that the chemical will adhere to and enter the target surface to create the desired result. Surfactants can either be part of the total product formulation or added separately when preparing to spray.

Weedmaster 360 Herbicide is safer to use near waterways

Weedmaster 360 Herbicide will not harm aquatic fauna. So when you need to control unwanted vegetation in situations where water may pond or flow, it's reassuring to know that Weedmaster 360 Herbicide is approved for use in areas such as wetlands, streams, lakes, dams, channels and drains.

A range of packaging options for Weedmaster 360 Herbicide

We are committed to improving packaging so that it's safer and easier to use our products.

With Nufarm Envirodrum - our mini-bulk returnable container, you can reduce operator exposure to liquid chemicals. Envirodrum is a closed chemical transfer system that allows spray operators to lock in a delivery hose connected to a motorised or hand pump, then safely transfer required amounts of product directly into the spray equipment.

For those who need smaller volumes, we have introduced a 10 litre pack to compliment the standard 20 litre and 5 litre containers.

The benefits of Weedmaster 360 Herbicide

- Controls a wide range of emerged annual, perennial and aquatic weeds and other unwanted plants.
- Contains surfactant that is safe to use in areas where aquatic fauna may be present in various waterway situations such as wetlands, streams, lakes, dams, channels and drains.
- Product is coloured green and easily differentiated from other liquid glyphosate formulations.
- Label directions now includes a specific aquatic weeds table.
- Non-residual, non-volatile, biodegradable and environmentally safe.
- Packaging options include 1000 L, 200 L, 110 L Envirodrum, 20 L, 10 L and 5 L.
