

Freeway Gold ensures pesticide penetration

Freeway Gold is an incredibly effective surfactant based on organosilicone technology. Freeway Gold works by decreasing the surface tension of spray droplets so much, that the entire leaf surface can be wet by a small amount of spray solution. This greatly increases coverage, improves wetting of waxy leaves, and gets pesticides to difficult-to-reach target sites.

The very low surface tensions produced with Freeway Gold allows stomatal flooding which cannot be achieved with normal non-ionic surfactants. This increases uptake of systemic pesticides through plant stomata, insect cuticle, and improves rainfastness.

Unlike other organosilicone surfactants, Freeway Gold is registered for use with fungicides, plant growth regulators and herbicides (particularly for woody weed control).
